ANALYSIS OF REAL GDP OF THE GCC COUNTRIES FROM 2000 TO 2025

This section examines the real GDP of the GCC countries. For this purpose, relevant data from 2000 to 2024 were collected and presented in Table 1 [1, 2, 3, 4, 5, 6, 7].

Table 1. Real GDP of the GCC Countries (in Constant 2015 Prices, USD Billion)

No.	Year	Bahrain	Qatar	Kuwait	UAE	Oman	Saudi Arabia	SA Share, %
1	2000	18,50	55,20	75,40	215,40	42,10	435,20	51.70
2	2001	19,10	58,40	76,80	222,10	43,50	442,10	51.29
3	2002	19,80	62,50	79,20	230,50	44,80	455,30	51.04
4	2003	20,60	68,90	82,10	245,80	46,20	485,60	51.16
5	2004	21,50	78,40	86,50	265,40	48,10	510,20	50.51
6	2005	22,40	92,10	91,40	288,50	50,50	538,40	49.70
7	2006	23,20	105,80	95,80	312,40	53,20	555,10	48.46
8	2007	24,10	118,50	98,20	335,60	55,80	572,30	47.52
9	2008	24,80	130,20	100,50	350,20	58,40	595,80	47.29
10	2009	25,10	135,40	96,80	355,10	60,10	588,40	46.67
11	2010	25,80	145,80	98,50	368,40	62,50	615,20	46.74
12	2011	26,50	158,20	102,40	385,20	65,80	648,50	46.77
13	2012	27,20	165,40	108,50	402,10	68,40	675,30	46.67

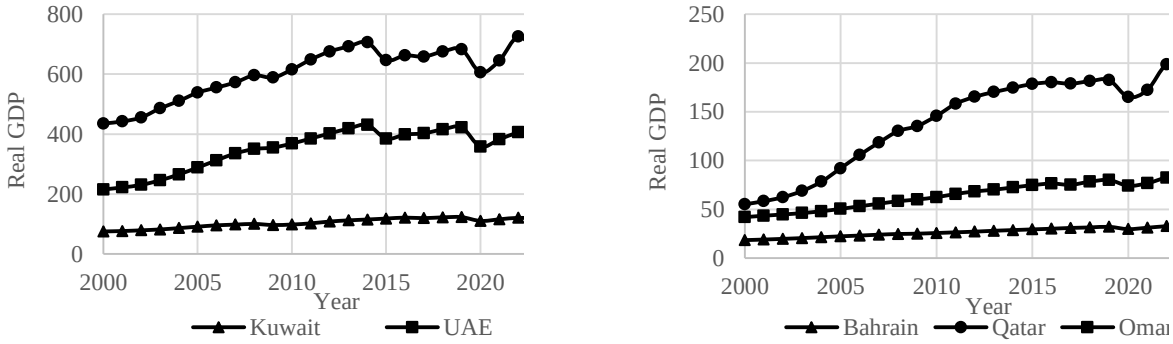

14	2013	28,10	170,20	112,40	418,50	70,20	692,10	46.40
15	2014	28,80	174,50	115,20	430,20	72,50	705,80	46.22
16	2015	29,50	178,50	118,40	385,20	74,80	646,30	45.11
17	2016	30,20	180,20	121,50	398,40	76,50	662,10	45.08
18	2017	31,00	178,80	119,80	402,50	75,20	658,40	44.92
19	2018	31,50	181,40	122,50	415,80	78,40	675,20	44.87
20	2019	32,10	182,50	123,10	422,40	80,10	682,50	44.82
21	2020	29,80	165,20	110,50	358,40	74,20	605,80	45.08
22	2021	31,20	172,40	115,80	382,50	76,80	645,20	45.31
23	2022	32,80	198,40	120,80	405,60	82,50	725,40	46.34
24	2023	33,50	195,10	118,20	420,10	83,80	678,50	44.37
25	2024	34,20	205,80	121,50	438,50	86,20	710,20	44.49
26	2025	35,20	215,60	125,40	455,80	89,50	745,20	44.71

Note: Data for 2000–2023 are actual values from the World Bank; for 2024–2025, they are IMF forecast estimates. The "Saudi Arabia Share (%)" column shows the proportion of Saudi Arabia in the aggregate real GDP of the six GCC countries [1, 2, 3, 4, 5, 6, 7].

2. General Characteristics of the Region

The aggregate real GDP of the GCC countries grew from USD 841.80 billion in 2000 to USD 1,666.70 billion in 2025, representing a total increase of 98.0% and a compound annual growth rate (CAGR) of 2.76% [1, 2, 3, 4, 5, 6, 7]. Unlike nominal indicators, which grew 6–7 times over this period due to dollar inflation and rising commodity prices, real GDP reflects the actual physical doubling of the region's production capacity. This clearly demonstrates that a significant portion of the Persian Gulf's "oil wealth" is driven by price conditions rather than solely by the expansion of physical production. In absolute terms, the increase amounted to USD 824.90 billion in constant 2015 prices. At the same time, as can be seen from Table 2.5, Saudi Arabia's physical share in the region is gradually declining

(from 51.70% to 44.71%), giving way to the diversified and gas-driven economies of its neighbors.

a *b*

Fig. 1. Dynamics of Real GDP of the GCC Countries in Constant 2015 Prices, USD Billion

Figure 2.5, constructed on the basis of Table 2.5, clearly shows how real GDP values change over the years.

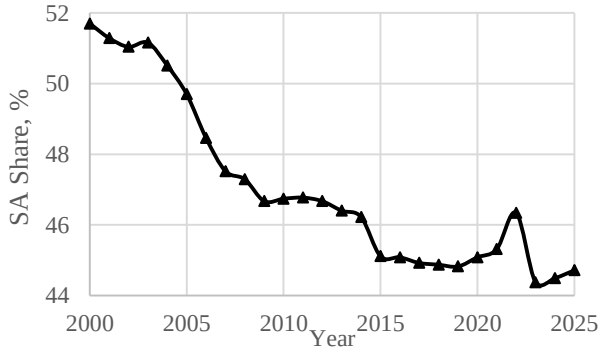

Fig. 2. Share of Saudi Arabia in the Aggregate Real GDP of the GCC Countries

Bahrain: Resilience of a Small Economy

Bahrain is the smallest economy in the region in terms of real GDP. GDP grew from USD 18.50 billion in 2000 to USD 35.20 billion in 2025 (forecast), representing a total increase of 90.3% and a CAGR of 2.55% [1].

Bahrain's share in regional real GDP declined from 2.2% in 2000 to 2.1% in 2025 (−0.1 percentage points) [1, 2, 3, 4, 5, 6, 7]. With a small absolute scale, the economy demonstrates stable growth without sharp fluctuations.

Bahrain has the smallest oil reserves among the GCC countries and therefore has historically positioned itself as the banking and financial center of the Middle East. In the 1970s–1980s, Bahrain was the main financial hub of the region; however, in the 1990s it ceded this role to Dubai. Nevertheless, the banking sector remains an important part of the economy, generating real value added [1].

The second key sector is the aluminum industry. Aluminium Bahrain (Alba) is one of the largest aluminum smelters in the world, with a production capacity of over 1.5 million tons per year. The plant provides a significant share of exports and creates real value added independent of oil prices [1].

The oil shock of 2015 caused a decline in real GDP of 2.4% (from USD 28.80 billion in 2014 to USD 29.50 billion in 2015)—the minimum in the region [1]. Recovery was stable: +2.4% in 2016, +2.7% in 2017, +1.6% in 2018, +1.9% in 2019 [1].

The 2020 pandemic caused a decline in real GDP of 7.2% (to USD 29.80 billion)—the minimum in the region [1]. This is explained by the fact that the banking sector and aluminum industry proved less sensitive to global restrictions than tourism and aviation. Recovery in 2021 was 4.7%, in 2022—5.1%, in 2023—2.1% [1].

The IMF forecast for 2025 is USD 35.20 billion (+2.9%), which assumes the continuation of stable growth [7]. Bahrain demonstrates the greatest resilience among the small GCC economies.

Kuwait: Physical Ceiling and Political Crises

Kuwait shows the weakest real growth among all GCC countries. GDP grew from USD 75.40 billion in 2000 to USD 125.40 billion in 2025 (forecast), representing a total increase of only 66.3% and a CAGR of 2.06%—the minimum indicators in the region [3].

Kuwait's share in regional real GDP declined from 9.0% in 2000 to 7.5% in 2025 (−1.5 percentage points) [1, 2, 3, 4, 5, 6, 7]. The country's economy has effectively hit a physical ceiling in oil production, while diversification is proceeding extremely slowly due to chronic political crises and conflicts between the government and parliament, which block the implementation of major infrastructure projects.

Kuwait demonstrates the least stable dynamics. The oil shock of 2015 caused a decline in real GDP of 1.8% (from USD 115.20 billion in 2014 to USD 118.40 billion in 2015)—relatively moderate compared to neighbors [3]. However, the recovery was extremely weak: +2.6% in 2016, −1.4% in 2017, +2.3% in 2018 [3]. The economy was essentially treading water.

The 2020 pandemic caused a decline in real GDP of 10.5% (to USD 110.50 billion)—the second deepest in the region [3]. Recovery in 2021 was 4.8%, in 2022—4.3%, but in 2023 a new decline of 1.9% followed (to USD 118.20 billion), reflecting continued stagnation [3].

Kuwait's main problem is the inability to implement large-scale projects. The new Al Zour refinery (with a capacity of 615 thousand barrels per day), which was supposed to diversify the economy, was commissioned with multi-year delays and has still not reached full capacity. Similar problems exist with the Silk City (city of the future) and Failaka Island projects [3].

The IMF forecast for 2025 is USD 125.40 billion (+3.2%), which assumes moderate growth; however, even if implemented, the 2014 level (USD 115.20 billion) will be exceeded only slightly, which clearly demonstrates 11 years of stagnation [7]. Kuwait remains the region's outsider in terms of physical economic modernization.

Oman: Moderate Growth and Structural Challenges

Oman ranks fifth in the region in terms of real GDP. The economy grew from USD 42.10 billion in 2000 to USD 89.50 billion in 2025 (forecast), representing a total increase of 112.6% and a CAGR of 3.03% [5].

Oman's share in regional real GDP increased from 5.0% in 2000 to 5.4% in 2025 (+0.4 percentage points) [1, 2, 3, 4, 5, 6, 7]. With a relatively small scale, the economy demonstrates stable growth without sharp fluctuations.

Oman has smaller oil and gas reserves compared to its neighbors, so its development strategy focuses on the physical development of port logistics and tourism. The Port of Duqm, located at a strategic crossroads of trade routes between Asia, Africa, and Europe, is being developed as a major logistics hub with an industrial

zone. The Port of Salalah has become one of the largest container ports in the region. These projects generate real value added independent of oil prices [5].

The oil shock of 2015 caused a decline in real GDP of 3.6% (from USD 72.50 billion in 2014 to USD 74.80 billion in 2015)—relatively moderate [5]. Recovery began in 2016 (+2.3%), but in 2017 a decline of 1.6% followed, reflecting dependence on the oil sector [5].

The 2020 pandemic caused a decline in real GDP of 7.4% (to USD 74.20 billion)—the minimum in the region among oil-producing countries [5]. This is explained by Oman's lower dependence on oil exports compared to its neighbors and a more diversified economic structure (fishing, agriculture, port logistics, tourism).

Recovery in 2021 was 3.5%, in 2022—7.5% (maximum growth for the entire period), in 2023—1.6% [5]. The IMF forecast for 2025 is USD 89.50 billion (+3.8%), which assumes the continuation of moderate growth [7].

Qatar: Historic Gas Surge and Stabilization

Qatar is the absolute leader in real growth rates among all GCC countries. GDP grew from USD 55.20 billion in 2000 to USD 215.60 billion in 2025 (forecast), representing a colossal total increase of 290.6% and an average annual growth rate of 5.58% [2].

Qatar's share in regional real GDP more than doubled: from 6.6% in 2000 to 12.9% in 2025 (+6.3 percentage points) [1, 2, 3, 4, 5, 6, 7]. This is the largest change in share among all countries in the region and indicates the transformation of Qatar from a small emirate into one of the world's largest gas powers.

Unlike its neighbors, whose growth in the 2000s was predominantly extensive (increasing oil production), Qatar's economy underwent a qualitative structural shift. From 2000 to 2015, the emirate's real GDP grew more than threefold (from USD 55.20 to 178.50 billion) thanks to the physical commissioning of giant liquefied natural gas (LNG) facilities at the North Field, which Qatar shares with Iran (where it is called South Pars) [2].

The key driver of growth was the consistent expansion of production capacity:

- 2006—real GDP growth of 17.0% due to the launch of the first LNG trains
- 2008—growth of 12.8% (commissioning of additional capacity)
- 2010—growth of 10.2% (completion of the main development phase)

After 2015, growth rates stabilized at 2–3% per year, reflecting a plateau in production capacity. The slight decline in real GDP in 2023 (−1.7%, to USD 195.10 billion) is related to planned shutdowns of some gas trains for modernization and maintenance in preparation for the North Field Expansion project, which is expected to increase Qatar's production capacity from 77 to 126 million tons of LNG per year by 2027–2028 [2, 7].

Qatar demonstrates the highest sensitivity to global crises. In 2020, the pandemic caused a decline in real GDP of 9.5% (to USD 165.20 billion) due to reduced demand for LNG from Asia and Europe [2]. However, the recovery in 2021–2022 was record-breaking (+4.4% and +15.1%, respectively), reflecting Qatar's ability to rapidly increase exports as global demand recovered. The IMF forecast for 2025 is USD 215.60 billion (+4.8%), which assumes moderate growth until new capacity comes online [7].

Saudi Arabia: The 2023 Paradox and the Impact of OPEC+

Saudi Arabia remains the undisputed leader in the region in terms of absolute real GDP volumes. In 2000, the physical volume of the economy was valued at USD 435.20 billion (in 2015 prices), and by 2025 it is projected to reach USD 745.20 billion. The total growth over 25 years amounted to 71.2%, with an average annual growth rate of 2.16% [6]. Despite the fact that the kingdom's growth rates are lower than those of Qatar or the UAE, it is Saudi Arabia that forms the foundation of the entire region's production potential and determines its place in the global economy.

The dynamics of Saudi Arabia's share in the region's aggregate real GDP, clearly reflected in the rightmost column of Table 2.5, deserves special attention. In 2000, the kingdom controlled 51.70% of the total physical production of the six Gulf countries—that is, more than half of the regional economic potential [1, 2, 3, 4, 5, 6, 7]. However, over the subsequent quarter century, this share steadily declined, reaching 44.71% by

2025 (a decrease of 6.99 percentage points). This trend is explained by two factors. First, the faster growth rates of Qatar in 2000–2015, when the emirate made a gas leap and more than doubled its share in regional GDP. Second, the successful diversification of the UAE, which expanded non-oil production independently of oil quotas. Notably, the historical minimum of Saudi Arabia's share was recorded in 2023 at 44.37%. This figure is directly linked to the OPEC+ paradox: it was in that year that Riyadh voluntarily cut physical production to support global prices, "ceding" part of its real economic weight to its neighbors. At the same time, in 2022, when the kingdom increased production amid the European energy crisis, Saudi Arabia's share briefly jumped to 46.34%. Thus, the "Saudi Arabia Share (%)" column clearly demonstrates that Saudi Arabia's leadership in the region is gradually eroding not because of the weakness of its economy, but because of the more intensive development of neighbors who diversified faster and were not as tightly bound to oil quotas.

The dynamics of Saudi Arabia's real GDP demonstrates the main macroeconomic paradox of the region: the decoupling of economic growth from oil prices in favor of dependence on production quotas. In 2022, against the backdrop of the global energy crisis and growing demand for hydrocarbons, the kingdom sharply increased physical production volumes, which led to a record real GDP growth of 11.5%—the highest figure in the last 15 years [6]. However, in 2023, a unique situation occurred: with relatively high global oil prices (averaging around USD 80 per barrel of Brent), Saudi Arabia's real GDP contracted by 6.5% (to USD 678.50 billion) [6]. This was due to Riyadh's voluntary decision to cut production by 1.5 million barrels per day under OPEC+ agreements to support the market and prevent oversupply. The country's economy deliberately "slowed down" physical production while maintaining high currency revenues through higher prices. This paradox clearly shows that the real GDP of oil-producing countries increasingly depends not on market conditions but on the political decisions of the cartel [6].

The oil shock of 2014–2015 caused a decline in real GDP of 8.4% (from USD 705.80 billion in 2014 to USD 646.30 billion in 2015) [6]. Interestingly, unlike nominal

GDP, which collapsed by 12–15%, the real decline was less severe, as physical production volumes decreased more slowly than prices fell. Recovery began in 2016 (+2.4%), but in 2017 another decline followed (−0.6%) due to the first OPEC+ deal, when Saudi Arabia agreed to quotas [6].

The 2020 pandemic caused a decline in real GDP of 11.1% (to USD 605.80 billion)—the deepest contraction for the entire observation period [6]. However, the recovery in 2021–2022 was rapid (+6.5% and +11.5%, respectively), reflecting the kingdom's ability to quickly ramp up production when restrictions were lifted. The IMF forecast for 2025 projects growth to USD 745.20 billion (+4.9%); however, this forecast may be revised downward if OPEC+ agreements are extended [7].

United Arab Emirates: The Triumph of Diversification

The UAE ranks second in the region in terms of absolute real GDP volume. In 2000, the physical volume of the economy was valued at USD 215.40 billion, and in 2025 it is projected at USD 455.80 billion [4]. Total growth: 111.6%, CAGR: 3.03% [4].

The UAE's share in regional real GDP increased from 25.6% in 2000 to 27.3% in 2025 (+1.7 percentage points) [1, 2, 3, 4, 5, 6, 7]. This is the only case among the major GCC economies where a country's share in regional real GDP increased (rather than declined), reflecting a successful diversification strategy.

The UAE demonstrates the highest quality and most sustainable growth among the major GCC economies. Unlike Saudi Arabia and Kuwait, the UAE's real GDP does not show sharp declines in years of OPEC+ deals. This is a direct consequence of successful diversification: tourism, aviation (Emirates, Etihad, flydubai), logistics (Jebel Ali and Khalifa ports), real estate, financial services (DIFC, ADGM), and new sectors (crypto industry, artificial intelligence, space technologies) generate real value added that is independent of oil barrels [4].

The oil shock of 2015 caused a decline in real GDP of 10.5% (from USD 430.20 billion in 2014 to USD 385.20 billion in 2015) [4]. However, this was related not only to oil but also to a correction in the real estate market after the overheating of 2008–2014. Recovery began in 2016 (+3.5%) and continued in subsequent years.

The 2020 pandemic caused a decline in real GDP of 10.7% (to USD 358.40 billion)—the second deepest in the region after Saudi Arabia [4]. This is explained by the UAE's high dependence on tourism and aviation, which were virtually paralyzed by global restrictions. However, the recovery in 2021–2022 was rapid (+6.7% and +6.0%, respectively), facilitated by the successful hosting of Expo 2020 Dubai (actually held in 2021–2022) and an aggressive policy of attracting foreign investment and talent [4].

In 2023, the UAE's real GDP grew by 3.6% (to USD 420.10 billion), and in 2024 growth of another 4.4% is projected (to USD 438.50 billion) [4]. The IMF forecast for 2025 is USD 455.80 billion (+3.9%), reflecting the continued successful implementation of the "We the UAE 2031" strategy aimed at further diversification and development of non-oil sectors [7].

3. Comparative Analysis

Ranking of Countries by Real GDP Growth Rates (2000–2025)

Table 2.6. Ranking of GCC Countries by Real GDP Growth Rates

No.	Rank	Country	CAGR, %	Total Growth, %
1	1	Qatar	5.58	+290.6
2	2	UAE	3.03	+111.6
3	3	Oman	3.03	+112.6
4	4	Bahrain	2.55	+90.3
5	5	Saudi Arabia	2.16	+71.2
6	6	Kuwait	2.06	+66.3

Source: Calculations were made based on data [1, 2, 3, 4, 5, 6, 7].

The Gap Between Nominal and Real (The 2015 Effect)

The most important analytical finding is that real GDP ignores price shocks. The collapse in oil prices in 2014–2015 caused the nominal GDP of the Gulf countries to plummet by 15–30%; however, real GDP continued to grow or showed a moderate decline (3–10%), as physical oil export volumes did not decrease. This proves that the

2015 downturn was exclusively financial (a reduction in revenue), not physical (a shutdown of plants and wells).

Impact of the Pandemic and Global Demand

The only periods of mass physical decline were 2009 and 2020. In 2020, the pandemic caused a decline in regional real GDP of 8.4% (from USD 2,193.10 billion in 2019 to USD 2,009.10 billion in 2020) due to the global shutdown of transport, tourism, and logistics, which hit even the diversified UAE and Bahrain [1, 2, 3, 4, 5, 6].

The Effect of OPEC+ Policy

Starting from 2017, the real GDP of the GCC countries became hostage to OPEC+ agreements. Countries deliberately sacrifice physical GDP growth rates (in the oil sector) in order to keep prices at high levels and compensate for losses through nominal revenues. In 2023–2024, this effect became the main constraining factor for Saudi Arabia and Kuwait, whose real GDP contracted by 6.5% and 1.9%, respectively, despite high oil prices [6, 7].

Success of Diversification

Countries that have successfully diversified their economies (UAE, Bahrain, Oman) demonstrate more stable real GDP dynamics and recover faster after crises. Conversely, economies dependent solely on oil (Saudi Arabia, Kuwait) are subject to artificial fluctuations due to participation in OPEC+ deals and political decisions on quotas.

** Calculation methodology: To eliminate the effects of inflation and exchange rate fluctuations in calculating the real GDP CAGR, the chain index method in constant prices of the base year 2015 was used. This allows for the assessment of the true change in physical volumes of value added, as prescribed by the methodology of the System of National Accounts (SNA* 2008) [9].

CONCLUSIONS

1. Bahrain: Demonstrated high resilience of real GDP to oil shocks. The decline in 2015 was -2.4%, and in 2020 it was -7.2%, which is the lowest rate in the region due to the development of the banking sector and the aluminum industry.

2. Kuwait: Showed the lowest growth rate of real GDP (CAGR 2.06%, total growth 66.3%). The share decreased from 9.0% to 7.5%. The level in 2024 did not reach the peak value of 2014, confirming the stagnation of physical production.
3. Oman: Increased its share in the regional real GDP from 5.0% to 5.4% (+0.4 p.p.) with a CAGR of 3.03%. The decline in 2020 (-7.4%) was the lowest among oil-producing countries in the region due to the development of port logistics and tourism.
4. Qatar: Achieved the highest growth rate of real GDP in the region (CAGR 5.58%, total growth 290.6%). The country's share increased from 6.6% to 12.9% (+6.3 p.p.) due to the physical launch of LNG production capacities.
5. Saudi Arabia: Maintained leadership in absolute volume, but its share in the total real GDP decreased from 51.70% to 44.71% (-6.99 p.p.) with a CAGR of 2.16%. In 2023, a decline of 6.5% was recorded due to voluntary production cuts under OPEC+, despite high global oil prices.
6. UAE: The only major economy in the region to increase its share in the total real GDP (from 25.6% to 27.3%, +1.7 p.p.) with a CAGR of 3.03%. This indicates the effectiveness of the diversification strategy into non-oil sectors.
7. Gap between nominal and real GDP: The collapse in oil prices in 2014-2015 caused nominal GDP in the Gulf countries to fall by 15-30%, while real GDP showed a moderate decline (3-10%). This confirms that the 2015 crisis was financial rather than production-related.
8. Impact of OPEC+: Since 2017, the physical growth of real GDP in Saudi Arabia and Kuwait has been constrained by production quotas. Countries consciously sacrifice physical production volumes to maintain high global prices.
9. Factor of global crises: 2009 and 2020 were the only periods of mass physical decline in the region. The 2020 pandemic caused an 8.4% drop in the total real GDP of the GCC due to the halt in transport and tourism.
10. Resilience of diversified economies: Countries with a diversified structure (UAE, Bahrain, Oman) demonstrate more stable real GDP dynamics and recover faster from crises compared to resource-dependent economies (Saudi Arabia, Kuwait).
