INTRODUCTION

The calculation and prediction of GDP, the primary indicator of an economy, as well as the estimation of population size, both for individual countries and the world as a whole, are the subject of numerous monographs and articles. Consequently, many people constantly face the question of what direction their own country's economy, and the global economy in particular, will take in the near future, and how this will affect the income of the average citizen.

Based on the analysis of statistical data variables, the author has derived polynomial dependencies with sufficiently high correlation coefficients for most of them, which allows for the prediction of the considered variable values with a high degree of accuracy.

This book is dedicated to my son, *Mikhail*, and to the memory of my parents and elder brother.
